

**Course Title:** Software Quality Assurance

**Course Code:** SE 403

Assignment on

**Website performance and Improvement**

**Submitted by:**

Faysal Sarder (181472515)

Sorefa Akter (181472591)

Batch: 47<sup>th</sup>

**Submitted To:**

MD Safaet Hossain

Associate Professor & Head of Dept. of CSE at City University

Submission Date: 30-10-2021

## **Website Performance Testing and its Improvement**

In our assignment, we use website performance testing tools **GTmetrix** and **Pingdom Website Speed Test** to check website Performance, Speeds and how to improve it.

For testing we choose 2 websites that's are <https://www.rokomari.com/> and <https://www.othoba.com/>. Website performance testing tools **GTmetrix** and **Pingdom Website Speed Test** are applied on these websites and generate testing reports.

In the following below shown the performance reports of the website that's generated by using **GTmetrix** and **Pingdom Website Speed Test** also with comparison between the performance reports of both websites.

If we look at the performance reports that's we get using the **GTmetrix** and **Pingdom Website Speed Test** web performance testing tool, there are some issues (impacts) that occur for that reason website performance is reduced and as well as some other reasons like how many users access the website at that particular time, page size, requests, backend working time etc. affect the speed therefore performance automatically reduces. Fixed these impacts, we improve the website performance and increase speed of it.

# Performance Report for https://www.rokomari.com/ (using GTmetrix)

## Executive Summary

## Performance Report for: http://www.rokomari.com/

Report generated: Wed, Oct 27, 2021 2:54 AM -0700

Test Server Location: Vancouver, Canada

Using: Chrome (Desktop) 90.0.4430.212, Lighthouse 8.3.0

## How does this affect me?

Today's web user expects a fast and seamless website experience. Delivering that fast experience can result in increased visits, conversions and overall happiness.

As if you didn't need more incentive, **Google has announced that they are using page speed in their ranking algorithm.**

## About GTmetrix

**CARBON60**  
THE MANAGED CLOUD COMPANY

GTmetrix is developed by the good folks at **Carbon60**, a Canadian hosting company with over 25 years experience in web technology.

IMPACT	AUDIT	
High	Avoid enormous network payloads	Total size was 5.74MB
Med-High	Avoid an excessive DOM size	4,261 elements
Med	Avoid large layout shifts	5 elements found
Med-Low	Serve static assets with an efficient cache policy	Potential savings of 286KB
Med-Low	Use a Content Delivery Network (CDN)	20 resources found
Med-Low	Avoid document.write()	1 instance found
Med-Low	Avoid chaining critical requests	11 chains found
Med-Low	Avoid long main-thread tasks	8 long tasks found
Low	Use passive listeners to improve scrolling performance	1 event listener not passive
Low	Ensure text remains visible during webfont load	5 fonts found
Low	Eliminate render-blocking resources	Potential savings of 16ms
Low	Reduce JavaScript execution time	630ms spent executing JavaScript
Low	Reduce unused JavaScript	Potential savings of 273KB
Low	Enable text compression	Potential savings of 153KB
Low	Properly size images	Potential savings of 1.44MB
Low	Avoid multiple page redirects	Potential savings of 584ms
Low	Efficiently encode images	Potential savings of 132KB
Low	Reduce unused CSS	Potential savings of 110KB
Low	Serve images in next-gen formats	Potential savings of 182KB
Low	Reduce initial server response time	Root document took 210ms
Low	Avoid serving legacy JavaScript to modern browsers	Potential savings of 44.1KB
Low	Defer offscreen images	Potential savings of 1.35MB
Low	Avoid non-composited animations	169 animated elements found

Low	Minify JavaScript	Potential savings of 4.15KB
N/A	Largest Contentful Paint element	1 element found
N/A	Minimize main-thread work	Main-thread busy for 2.5s
N/A	Reduce the impact of third-party code	Total size was 387KB
N/A	User Timing marks and measures

Improve page performance

GRADE	SUGGESTION	
F 0	Make fewer HTTP requests	
<p>Decreasing the number of components on a page reduces the number of HTTP requests required to render the page, resulting in faster page loads. Some ways to reduce the number of components include: combine files, combine multiple scripts into one script, combine multiple CSS files into one style sheet, and use CSS Sprites and image maps.</p>		
F 0	Compress components with gzip	
<p>Compression reduces response times by reducing the size of the HTTP response. Gzip is the most popular and effective compression method currently available and generally reduces the response size by about 70%. Approximately 90% of today's Internet traffic travels through browsers that claim to support gzip.</p>		
F 0	Use cookie-free domains	
<p>When the browser requests a static image and sends cookies with the request, the server ignores the cookies. These cookies are unnecessary network traffic. To workaround this problem, make sure that static components are requested with cookie-free requests by creating a subdomain and hosting them there.</p>		
F 0	Add Expires headers	
<p>Web pages are becoming increasingly complex with more scripts, style sheets, images, and Flash on them. A first-time visit to a page may require several HTTP requests to load all the components. By using Expires headers these components become cacheable, which avoids unnecessary HTTP requests on subsequent page views. Expires headers are most often associated with images, but they can and should be used on all page components including scripts, style sheets, and Flash.</p>		
F 25	Reduce DNS lookups	
<p>The Domain Name System (DNS) maps hostnames to IP addresses, just like phonebooks map people's names to their phone numbers. When you type URL www.yahoo.com into the browser, the browser contacts a DNS resolver that returns the server's IP address. DNS has a cost; typically it takes 20 to 120 milliseconds for it to look up the IP address for a hostname. The browser cannot download anything from the host until the lookup completes.</p>		
D 70	Avoid URL redirects	
<p>URL redirects are made using HTTP status codes 301 and 302. They tell the browser to go to another location. Inserting a redirect between the user and the final HTML document delays everything on the page since nothing on the page can be rendered and no components can be downloaded until the HTML document arrives.</p>		

You may expect a browser to do nothing when it encounters an empty image src. However, it is not the case in most browsers. IE makes a request to the directory in which the page is located; Safari, Chrome, Firefox 3 and earlier make a request to the actual page itself. This behavior could possibly corrupt user data, waste server computing cycles generating a page that will never be viewed, and in the worst case, cripple your servers by sending a large amount of unexpected traffic.
